

— AI TASKFORCE

AI Taskforce update

Sayakaya Analytics — progress, use cases, and what's next

Every ad-hoc question waited in a queue

Sayakaya's business data lives in BigQuery. Answering a simple question — "which fund grew fastest last month?" — meant filing a request and waiting on someone to write SQL by hand.

That queue slowed down the people closest to the business: operations, marketing, finance, and other divisions.

One dashboard, reading the warehouse live

‡ optional — Claude API for natural-language questions

Ten working tabs today, covering the full data surface:

The scale the AI layer already operates on

Live sample as of July 2026 – figures move with the warehouse

— USE CASE

Portfolio: search an investor, export a report in one click

The most-used tab on the platform. One search by SID, name, or email surfaces an investor's holdings, AUM, and performance — no SQL required.

One-click PDF report

Every investor's portfolio, ready to hand to servicing, compliance, or the investor themselves — no manual assembly.

Two AI layers: ask in plain English, forecast what's next

01 — ASK

Natural-language questions

Powered by Claude. Turns a plain-English question into SQL, runs it, and suggests a chart — resolving real fund and manager names instead of guessing.

02 — PREDICT

Forecasting & churn scoring

Powered by BigQuery ML. Forecasts AUM and transaction volume, and scores every current holder's likelihood of fully redeeming.

— USE CASE

Ask: a plain-English question in, a query and chart out

The screenshot displays the 'sayakaya-analytics' web application. The header shows the title 'sayakaya-analytics – Ask, running live against BigQuery'. On the left, a sidebar menu includes sections for 'INVESTOR' (Portfolio), 'DASHBOARDS' (Overview, AUM history, Performance, Growth), and 'OPERATIONS' (Reconciliation, Revenue, Predict). The main interface features a 'Talk with Data' section with a text input containing 'top 10 funds by aum' and an 'Ask' button. Below the input are several suggested queries. An 'Advanced (optional)' section is also present. The 'Generated SQL' section shows the resulting SQL query:

```
SELECT id, name, latest_aum_value
FROM `sayakaya.main.funds`
ORDER BY latest_aum_value DESC
LIMIT 10
```

 To the right of the SQL are buttons for 'Copy', 'Edit', 'Run', 'CSV', and 'Excel'. Below the SQL, it indicates '10 rows' and shows a preview of a bar chart with 'name' on the x-axis and 'latest_aum_value' on the y-axis. At the bottom right, there is a 'Suggest' button.

Talk with Data Just use your mother language to get the data — no technical skills needed.

top 10 funds by aum Ask

Top 10 funds by AUM How many verified users do we have? Completed buy volume per month in 2025 Transaction count by status Top 5 investment managers by fund count

► Advanced (optional)

Generated SQL Copy Edit Run CSV Excel

```
SELECT id, name, latest_aum_value
FROM `sayakaya.main.funds`
ORDER BY latest_aum_value DESC
LIMIT 10
```

10 rows

Bar name vs latest_aum_value Optional: describe the chart you want Suggest

Real question, real generated SQL, real chart — nothing staged

— USE CASE

Predict: forecasting AUM, flagging churn early

AUM forecast — ARIMA_PLUS, 30-day horizon

Churn scoring — logistic regression, current holders

What this changes for the business

BEFORE	NOW
Ad-hoc questions wait for an engineer to write SQL	Ask a question in plain English, get an answer in seconds
Ledger vs. custodian checks done by hand in spreadsheets	Reconciliation tab compares app and KSEI feeds automatically
Churn is discovered after an investor fully redeems	Every current holder is scored — overall churn sits at 2.3% today, and risk is visible before it happens
Reports assembled by hand from screenshots and exports	One-click CSV, Excel, and per-investor PDF reports

Guardrails on every query

Cost caps

Every query — including AI-generated ones — carries a hard byte-billed cost cap, estimated before it runs.

No SQL injection

All user input — dates, filters, search — is a named parameter. Never string-concatenated into a query.

Sensitive data blocked

Passwords and KYC documents are blocked at the query layer — never selectable, even in free-text SQL.

Read-only by design

Free-text SQL is read-only only. ML models are trained separately and only ever called at runtime.

Investor lookup surfaces the identifiers staff need — SID, name, email, IFUA. KYC documents, ID numbers, and passwords stay off-limits, at the query layer, everywhere in the app.

Shipped this year, proposed for next

SHIPPED

Live dashboard across four deployment targets

Ask: natural-language questions via Claude

Predict: AUM/volume forecasting and churn scoring

Automated reconciliation against the custodian feed

PROPOSED NEXT

Track adoption across analyst and operations teams

Extend churn scoring into retention campaigns

Retrain and expand forecasting models quarterly

Bring the Supabase deployment path onto CI

— HOW IT'S BUILT

Built with Claude, through vibe coding

Instead of a traditional multi-quarter build, this platform was developed through "vibe coding" — describing what the business needs in plain language, and iterating live with Claude to write, test, and refine the code.

That's how a small taskforce shipped a live dashboard, natural-language queries, and ML forecasting in one cycle — not a large engineering roadmap.

DESCRIBE

Explain the need in plain language

BUILD & TEST

Claude writes and runs the code live

REFINE

Review, adjust, and ship the same day

— CLOSING

From answering questions to anticipating them

The AI taskforce has turned Sayakaya's data into a live, trusted decision layer — one every division can use directly, and one we'll keep sharpening.

Thank you
