

AI TASKFORCE

AI Taskforce update

Sayakaya Analytics: from a working pilot to a 28-tab platform

RECAP

Where we left off in July

A working pilot: one dashboard reading BigQuery live, ten tabs, and two AI layers. **Ask** for natural-language questions, and **Predict** for forecasting and churn scoring.

It was already a working platform, just not yet the full one every division could rely on directly. Growing it into that has been the initiative since July.

The board's original mandate, from well before that, was simply to bring AI into the business. This is the progress report since then.

01 July pilot reviewed

02 Initiative: grow to a full platform

03 6 major workstreams shipped

04 Today: 28 working tabs

GROWTH SINCE JULY

From 10 tabs to 28 since July

10 → 28

working tabs

6

major workstreams shipped

1 → 2

independent deployment targets

DASHBOARDS 4

Overview · AUM history · Performance · Growth

OPERATIONS & FINANCE 11

Reconciliation · SInvest transactions · Revenue (PWC) · Revenue (GS) · User lifetime · Campaign revenue · Referral program · Remisier sharing (GS/PWC) · Remisier transactions · Predict

INVESTOR 7

Portfolio (PWC) · Portfolio Explorer (GS) · Portfolio Explorer (Main) · Portfolio (TX) · Portfolio (SInvest) · HNWI · Send statement

TOOLS, DOCS & ADMIN 6

Ask · Data explorer · SQL lab · Documentations · Manage users · Activity log

NEW SINCE JULY · 01

Every user now has their own login, and a paper trail

One shared password became a per-user system with self-service invites, password resets, roles, logging, and watermarking on every export.

Invite-by-email accounts

An admin invites a teammate by email; the new user sets their own password from an activation link. Login accepts username or email.

Self-service password reset

Reset links never reveal whether an account exists, expire in 30 minutes, and sign that user out everywhere else.

Full audit log

Every login and every export is logged and searchable by user and date, in its own Activity log tab.

Export watermarking

Every CSV, Excel, and PDF is stamped with who pulled it and when. No anonymous exports.

Also: passwords and KYC stay redacted at the query layer, sessions expire after 8 hours, and new email schedules need a 6-digit OTP.

NEW SINCE JULY · 01B

Role-based access control, live and verified in production

Access starts at zero. An admin grants each person exactly the sections they need, tab by tab, across all 28; nothing is on by default.

Section-level, not all-or-nothing

All 28 sections are individual checkboxes in the admin panel, grantable in any combination.

Two tiers

Standard users see only what is checked. Superusers see everything, including user management and the audit log.

Enforced twice

The same permission set hides the tab and blocks the API. A direct request to a restricted section is rejected server-side.

Verified this cycle

Confirmed end-to-end in production: invite, scope, and both the sidebar and the API respecting that scope.

MANAGE USERS / SECTION ACCESS

Overview GRANTED

Portfolio Explorer (Main) GRANTED

Send statement GRANTED

SQL lab OFF

Activity log SUPERUSER

Example scope for one operations analyst

NEW SINCE JULY · 02

English or Bahasa Indonesia, plus a second independent backend

EN

ID

Bilingual dashboard

Every section, KPI card, and chart legend switches language live, with no reload, so one platform serves English- and Indonesian-speaking staff.

2 TARGETS · ROUTE-FOR-ROUTE

Two deployment targets

The dashboard also runs as a fully independent Supabase Edge Function + GitHub Pages deployment. Exports, PDFs, ML, and Ask are mirrored on both, with no single hosting dependency.

Netlify

Supabase + GitHub Pages

Seven new sections cover more of the investor lifecycle

HNWI

A dedicated view for high-net-worth holders, with risk-profile columns and independent per-fund AUM filters.

Portfolio Explorer (Main) & Portfolio (TX)

Holdings priced live off the transaction ledger, not end-of-day snapshots, with Portfolio (SInvest) as a second source for cross-checking.

Referral program

Tracks Sep–Dec 2026 T&C eligibility for the referral incentive, ready for campaign launch.

User lifetime & Campaign revenue

Retention and campaign ROI in one place, next to the revenue tabs.

Plus: a Google Sheet export on every Portfolio lookup. One click adds an investor's portfolio to a shared tracker sheet.

Send Statement: email an investor their portfolio in one click

sayakaya-analytics / Send statement

FIND INVESTOR

Search by SID, name, or email...

PORTFOLIO AS OF

31 Aug 2026

E-STATEMENT MONTH

August 2026

Portfolio & transaction preview: the attached PDF, shown before sending

Compose email →

Search an investor, pick a portfolio date and transaction month, then preview the exact PDF that will be attached before anything sends.

The compose step shows an editable subject and body, pre-filled with a default letter, so servicing can personalize it without leaving the dashboard.

Shipped on both deployment targets in the same week.

USE CASE

Same emails, now on autopilot: daily, weekly, or monthly

Send Statement and Send Fund Performance can now run themselves, set up from the same tab used for one-off sends.

Every scheduled send lands in the same audit trail as a manual one, searchable by recipient, date, and job.

NEW AUTOMATED SCHEDULE

Monthly, last day

08:00 WIB

Recipients: all AUM investors

A one-time code is emailed to confirm. A schedule only goes live once it's entered.

01

Schedule armed,
OTP-confirmed

02

Cron ticks every ~15
min, redundant

03

Sent at scale,
queued and logged

Reports now match the paperwork investors already trust

PT Sayakaya Lahir Batin

CUSTOMER PORTFOLIO.pdf

CLOSE NAV / 1 SEPTEMBER 2026

FUND	UNIT	VALUE	GAIN
Sucorinvest Money Market	1.000,12	1.987.240	87.117
Trimegah Saham Syariah	500,50	1.301.300	50.050

Indonesian date formatting, official letterhead, and “CLOSE NAV” labeling, matching the custodian’s own statement layout.

REKSA DANA UPDATE / MONEY MARKET			02 SEP 2026
FUND	NAV	1D	YTD
Sucorinvest MMF	1987,24	+0,02%	+2,65%
TRIM Kas 2 Kelas A	2051,09	-0,01%	+2,72%

Brand-blue header, alternating rows, green/red change columns, mirroring the official NAV update sheet. Shipped this week on both targets.

More guardrails, not fewer

Cost caps

Every query, including AI-generated ones, carries a hard byte-billed cost cap, estimated before it runs.

No SQL injection

All user input (dates, filters, search) is a named parameter, never concatenated into a query string.

Sensitive data blocked

Passwords and KYC documents are blocked at the query layer, never selectable, even in free-text SQL.

Read-only by design

Free-text SQL is read-only. ML models are trained separately and only ever called at runtime.

New this cycle: per-user roles · export watermarking · full login and export audit log · sessions shortened to 8 hours

What this project buys the business

01

Faster, more confident decisions

A question about the business no longer waits on an engineer to write SQL. The answer comes back in seconds, from live data.

03

Investor trust, protected at scale

Statements, reports, and eligibility checks run themselves consistently, and every automated action stays reviewable one by one.

02

Lower operational risk

Who saw what, and who exported what, is recorded and traceable, not one shared password with no trail.

04

Resilience, no single point of failure

Two independent hosting backends and two independent schedulers keep investor communication running if one vendor goes down.

What changed for the business, since July

BEFORE

Ad-hoc questions wait for an engineer to write SQL

Investor statements assembled and emailed by hand, one at a time

Recurring sends meant someone remembering to do it every month

One shared login: everyone saw everything, or nothing

Churn is discovered after an investor fully redeems

One hosting provider, a single point of failure

NOW

Ask a question in plain English, get an answer in seconds

Send Statement: search, preview the PDF, edit and send, from the dashboard

OTP-confirmed schedules run on a redundant cron, logged like every other send

Per-user roles, a full audit log, and a watermark on every export

Every current holder is scored. Churn sits at **2.3%** today, visible before it happens

Two independent deployment targets, kept in sync route-for-route

Shipped since July, proposed for next

SHIPPED

Per-user login, roles, audit log, and export watermarking

EN/ID language toggle across the whole dashboard

Send Statement: one-click investor email with PDF portfolio

Seven new investor & operations sections

Second deployment target: Supabase Edge Function + GitHub Pages

Reports restyled to match the statement and NAV update sheet

Scheduled sending for Statement & Fund Performance, redundant cron

PROPOSED NEXT

Track adoption across analyst and operations teams

Extend churn scoring into retention campaigns

Retrain and expand forecasting models quarterly

Bring the Supabase deployment path onto CI, so a merged fix deploys itself

Batch scheduling controls: pause, retry, per-recipient status

HOW IT'S BUILT

Still one small taskforce, built with Claude

The approach hasn't changed since July: describe what the business needs in plain language, and iterate live with Claude to write, test, and refine the code.

Six major workstreams since July came out of that same small taskforce, with no separate engineering roadmap.

Access control & accounts · bilingual UI · a second independent backend · seven new investor-lifecycle sections · investor emailing · reporting that matches investor paperwork.

DESCRIBE

Explain the need in plain language

BUILD & TEST

Claude writes and runs the code live

REFINE

Review, adjust, and ship the same day

From answering questions to running the desk

Since July, the AI taskforce turned a working pilot into a 28-tab platform with its own access control, bilingual UI, and investor communications, still built and shipped by one small team.

Thank you
