AI Taskforce update

Sayakaya Analytics — from a working pilot to a 28-tab platform

— RECAP

Where we left off in July

We shared a working pilot: one dashboard reading BigQuery live, ten tabs, and two AI layers — **Ask** for natural-language questions and **Predict** for forecasting and churn scoring.

The July pilot was already a working platform — just not yet the full one every division could rely on directly. Growing it into that — not just analytics, but access control, investor communications, and reporting the business already trusts — has been an initiative since July. The board's original mandate, from well before that, was simply to bring AI into the business.

This is the progress report since then.

Activity log

Every user now has their own login — and a paper trail

In July, the dashboard was one shared password. It's now a per-user system with self-service invites, password resets, roles, logging, and watermarking on every export.

Invite-by-email account creation

No more shared password. An admin invites a teammate with just their email — the system sends an activation link, and the new user sets their own password on first login. Login now works with either username or email.

Self-service password reset

Forgot a password? Users request a reset link themselves. The reply never reveals whether an account exists, the link expires in 30 minutes, and resetting a password immediately signs that user out everywhere else.

Full audit log

Every login and every export is logged and searchable by user and date, in its own Activity log tab.

Export watermarking

Every CSV, Excel, and PDF a user downloads is stamped with who pulled it and when — no anonymous exports.

Also: sensitive fields (passwords, KYC) stay redacted at the query layer for every user, sessions now expire after **8 hours** (down from 7 days), and setting up an automated email schedule requires a **6-digit OTP** confirmed by email before it goes live.

Role-based access control, live and verified in production

Access starts at zero. An admin grants each person exactly the sections they need, tab by tab, across all 28 sections

— nothing is on by default.

Section-level, not all-or-nothing

Every one of the 28 sections — Dashboards, Investor, Operations & Finance, Tools/Docs/Admin — is its own checkbox in the admin panel, grantable individually in any combination.

Two tiers

Standard users see only the sections checked for them. Superusers always see everything, including User management and the Activity log.

Enforced twice, not just cosmetic

The same permission set hides the tab in the sidebar *and* blocks the underlying API — a direct request to a restricted section is rejected server-side, not just hidden in the UI.

Verified this cycle

Confirmed end-to-end in production: inviting a user, scoping them to a handful of sections, and both the sidebar and the API respecting exactly that scope.

English or Bahasa Indonesia — and a second, independent backend

/ Bilingual dashboard

Every section, KPI card, and chart legend switches language live, no reload — so the same platform serves both English- and Indonesian-speaking staff.

Two deployment targets

The dashboard now also runs as a fully independent **Supabase Edge Function + GitHub Pages** deployment. Every route — exports, PDFs, ML, Ask — is mirrored on both, so the team isn't dependent on a single hosting provider.

Seven new sections cover more of the investor lifecycle

HNWI

A dedicated view for high-net-worth holders, with risk-profile columns and independent per-fund AUM filters.

Portfolio Explorer (Main) & Portfolio (TX)

Holdings priced live off the transaction ledger, not just end-of-day snapshots — plus Portfolio (SInvest) as a second source for cross-checking.

Referral program

Tracks Sep–Dec 2026 T&C eligibility for the referral incentive, ready for the campaign launch.

User lifetime & Campaign revenue

Retention and campaign ROI in one place, next to the revenue tabs.

Plus: a **Google Sheet export** on every Portfolio lookup — one click adds an investor's portfolio to a shared tracker sheet, no manual copy-paste.

Send Statement: email an investor their portfolio in one click

sayakaya-analytics – Send statement

FIND INVESTOR

Search by SID, name, or email...

PORTFOLIO AS OF
31 Aug 2026

E-STATEMENT MONTH
August 2026

 Portfolio & transaction preview — attached PDF, shown before sending

Compose email →

Search an investor, pick a portfolio date and/or a transaction month, then preview the exact PDF that will be attached before anything sends.

The compose step shows an editable subject and body — pre-filled with a default letter — so servicing can personalize it without leaving the dashboard.

Shipped on both deployment targets, Netlify and Supabase/GitHub Pages, the same week.

Same emails, now on autopilot — daily, weekly, or monthly

sayakaya-analytics — New automated schedule

FREQUENCY

Monthly — last day

RUN TIME (WIB)

08:00

Recipients: All AUM investors

✉ A one-time code is emailed to confirm — a schedule only goes live once it's entered

Confirm & create schedule →

Send Statement and Send Fund Performance can now run themselves — daily, weekly, or monthly — set up from the same tab used for one-off sends, no separate tool.

Every scheduled send lands in the same audit trail as manual sends — searchable by recipient, date, and job.

Reports now match the paperwork investors already trust

CUSTOMER PORTFOLIO

CLOSE NAV — 1 September 2026

Fund Name	Unit	Value	Gain/Loss
Sucorinvest Money Market	1.000,12	1.987.240	87.117
Trimegah Saham Syariah	500,50	1.301.300	50.050

Indonesian date formatting, official letterhead, "CLOSE NAV" labeling — matches the custodian's own statement layout.

Reksa Dana Update.pdf

REKSA DANA UPDATE — MONEY MARKET

02 September 2026

No	Fund	NAV	1D	YTD
1	Sucorinvest MMF	1987.24	+0.02%	+2.65%
2	TRIM Kas 2 Kelas A	2051.09	-0.01%	+2.72%

Brand-blue header, alternating rows, green/red % change — mirrors the official NAV update sheet exactly. Shipped this week, on both deployment targets.

More guardrails, not fewer

Cost caps

Every query — including AI-generated ones — carries a hard byte-billed cost cap, estimated before it runs.

No SQL injection

All user input — dates, filters, search — is a named parameter. Never string-concatenated into a query.

Sensitive data blocked

Passwords and KYC documents are blocked at the query layer — never selectable, even in free-text SQL.

Read-only by design

Free-text SQL is read-only only. ML models are trained separately and only ever called at runtime.

New this cycle: per-user roles · export watermarking · full login/export audit log · sessions shortened to 8 hours

What this project actually buys the business

Faster, more confident decisions

Asking a question about the business no longer waits on an engineer to write SQL — the answer comes back in seconds, from live data. Decisions move at the speed of the question, not the speed of a request queue.

Lower operational risk

Who saw what, and who exported what, is now recorded and traceable — not a single shared password with no trail. If something ever needs to be traced back, the record already exists.

Investor trust, protected at scale

Reports, statements, and eligibility processes now run themselves, consistently — but every automated action is still logged and reviewable one by one. Moving faster hasn't come at the cost of accountability.

Resilience — no single point of failure

Two independent hosting backends and two independent schedulers mean investor communication and reporting don't depend on any one vendor staying up.

What changed for the business, since July

BEFORE	NOW
Ad-hoc questions wait for an engineer to write SQL	Ask a question in plain English, get an answer in seconds
Investor statements assembled and emailed by hand, one at a time	Send Statement: search, preview the PDF, edit, send — from the dashboard
Recurring sends meant someone remembering to do it manually every month	OTP-confirmed schedules run themselves on a redundant cron, logged like every other send
One shared login — everyone could see everything, or nothing	Per-user roles, a full audit log, and a watermark on every export
Churn is discovered after an investor fully redeems	Every current holder is scored — overall churn sits at 2.3% today, visible before it happens
One hosting provider — a single point of failure	Two independent deployment targets, kept in sync route-for-route
Reports assembled by hand from screenshots and exports	One-click CSV, Excel, Google Sheet, and per-investor PDF — styled like the real statement

Shipped since July, proposed for next

SHIPPED

Per-user login, roles, audit log, and export watermarking

EN/ID language toggle across the whole dashboard

Send Statement: one-click investor email with PDF portfolio + e-statement

Seven new investor & operations sections

Second deployment target: Supabase Edge Function + GitHub Pages

Reports restyled to match the official statement and NAV update sheet

Scheduled/automated sending for Send Statement & Send Fund Performance, on a redundant cron

PROPOSED NEXT

Track adoption across analyst and operations teams

Extend churn scoring into retention campaigns

Retrain and expand forecasting models quarterly

Bring the Supabase deployment path onto CI, so a merged fix deploys itself

Batch/bulk scheduling controls (pause, retry, per-recipient status)

Still one small taskforce, built with Claude

The approach hasn't changed since July: describe what the business needs in plain language, and iterate live with Claude to write, test, and refine the code — "vibe coding," not a multi-quarter build.

Six major workstreams* since July came out of that same small taskforce, with no separate engineering roadmap.

DESCRIBE

Explain the need in plain language

BUILD & TEST

Claude writes and runs the code live

REFINE

Review, adjust, and ship the same day

* Access control & accounts, bilingual UI, a second independent backend, seven new investor-lifecycle sections, investor emailing, and reporting that matches the paperwork investors already trust.

— CLOSING

From answering questions to running the desk

Since July, the AI taskforce turned a working pilot into a 28-tab platform with its own access control, bilingual UI, and investor communications — still built and shipped by one small team.

THANK YOU
